

Jev thread. **JevGAG** grounds the audit on a System One oracle: **Jev text** is the only pre-generation signal that works in the report (0.788); **Jev image** certifies identity independently ($\rho = +1.000$ vs. CLIP); a **pixel-only Jev critic** is at chance (**0.497**) — decision models need context, not pixels alone.

Outcome. a regime map plus calibrated components. Across T4 and A100, and across latent, pixel and flicker endpoints, the cheap mode was never worse: the optimal policy is a *fixed* mode, and the map states exactly where adaptivity becomes worth deploying.
